

My Documentation

Day 1: Creativity Pitch- School bullying as a world issue.

I created a creativity pitch highlighting school bullying as a world wide problem. However, when I tried to submit my work, the platform kept showing “upload failed”. This issue was frustrating and time consuming. Here I used **.pdf** formatting to submit my work.

Instead of giving up, I emailed the judge directly and explained the situation. After some time, they told me that they had resolved the issue and I was able to submit my work on time. I learned the importance of patience and communication because technical setbacks can happen, but finding solutions and staying calm under pressure are the key skills I gained.

I quickly knew that waiting for the platform to work wasn't an option. Emailing the judge was a logical thing to do at that moment. The upload failure was a major obstacle, but I didn't let it stop me. I handled it by being resourceful, which helped me meet the deadline and submit my work.

Day 2: Design- BeKIND Anti-bullying platform

I wanted to design a website called **BeKIND** to promote kindness and raise awareness about school bullying. The problem was that I had no coding skills and experience.

I used a platform called **Lovable** to bring my ideas to life. It allowed me to build the interface visually and I turned it into **HTML** but the backend was still code driven. I leaned on AI tools to assist with the technical parts.

I learned that relying heavily on shortcuts like AI can backfire. My project was flagged for AI usage, which taught me the value of learning foundational skills and doing things the right way. I gained insight into design and the importance of being sincere with creative work. I chose Lovable because it matched my vision and allowed me to express my ideas without needing deep coding knowledge. However, I now realize that understanding the tools I use is essential for credibility and growth.

The lack of coding skills and AI flag were tough setbacks. I handled them by reflecting on the experience and committing to learning the basics of coding so I can build future projects with integrity and confidence.

Day 3: Technical Test- Coding languages and platforms

I encountered a submission issue when trying to upload my work in **.docx** format. The system kept on showing **“upload failed”**, and I couldn't get confirmation from the judge after emailing him.

I took initiative and checked the list of accepted file formats. I converted my document to **.pdf** and resubmitted it. This time, the upload worked perfectly. I learned the importance of self-reliance. Whwn communication fails, it's crucial to find ways and solve problems independently.

I didn't wait for a reply. Instead, I investigated the issue myself, found a way and acted quickly to meet the deadline, because if I had waited for a reply, I would have missed the deadline, showing independence is important. It showed me to be resourceful under pressure.

The failed **.docx** upload and lack of response from the judge were frustrating. But I handled it by witching formats and solving the problem without delay.

Day 4: Documentation- Reflecting on my journey

I didn't face any problems today. It was a smooth process of organizing everything I had learned and experienced over the past few days. I documented with honesty and detail. I made sure to write the challenges and the lessons. Here I used **.docx** formatting to submit my work.

I gained deeper understanding of the mistakes I did and learned how to avoid them next time. This also strengthened my writing skills. I did the documentation as a way to showcase not just what I did, but how I evolved. I chose to be transparent about my mistakes and proud of my solutions.
